

## Using the Truss

- Check what is already attached (lanterns/ microphones etc.)
  - Ensure no one is underneath while it's being lowered.
- Truss can be moved with lanterns attached, however all cables must be unplugged.
- Truss can be moved with the 3 *Socapex* lighting extension cables attached. But they must be free to unwind.
  - Grey remote cable must be passed down to ground level.
- Make sure the chains in each corner are clear (no cables wrapped around).
- When using Truss, one person must be in the roof observing, another must be on ground level observing, and one person needs to operate.
- Safety sign must be put on the door for 'overheard working' while truss is in use.
- Try to have someone near the door at all times to ensure anyone who enters doesn't get injured.
- Person observing downstairs will communicate when the truss has reached the right height.
- Person operating must shout '**Truss coming in**' and '**Truss going out**' retrospectively to make sure everyone is aware.
  - Communicate and look after each other!
